

Frequently Asked Questions

- **What is Metis?**

Metis is an advanced AI that uses machine learning to predict breakouts in cryptocurrencies. It gives signals on Twitter whenever it finds a possible breakout, and then provides updates on those calls.

- **How does Metis work?**

Metis crawls the web 24/7 (social networks, TradingView.com, etc.) actively searching for coins that people are talking about. It then does checks on those coins (overall sentiment, fundamental analysis, upcoming events, etc.) using the data its crawlers have collected in the past. Once those checks are passed, it does Technical Analysis using Artificial Intelligence along with the past data from its Trade Simulator to finally decide whether it should give out a new signal or not. All in all, it consists of over 38 different scripts (growing every day as new features are added) that run 24/7 on its servers performing different tasks.

- **How accurate is Metis?**

The calls from Metis have a very high accuracy rate. For more details on the accuracy, check the pinned post on Twitter.

- **What exchanges does Metis support?**

Metis currently supports Bittrex, Binance, Cryptopia, and Kucoin, with more exchanges to be added in the future.

- **What is the best way to use Metis?**

The best way to use Metis is to jump on the calls immediately as soon as they come out and then sell when you're happy with the profits. And to make sure you don't miss out on a signal, subscribe to the tweets from Metis on Twitter so that you get an instant notification whenever a new signal comes out.

- **What is the duration of each call?**

The average duration of each call from Metis is 10 days.

- **What kind of returns can I expect from Metis?**

The calls from Metis NORMALLY give out returns between 5–200%, with some calls having given out even 500%+ in the past (in the same 10 day call duration period).

- **Does Metis work equally well in bear markets?**

Yes, Metis has a lot of checks in place due to which it gives out lesser calls in bear markets to protect users from bad trades. Due to this, the calls it gives out in such markets may not offer a very high return.

- **Why do some coins sometimes see sudden pumps and then retrace quickly when a new signal comes out?**

Since a large number of people jump on a call as soon as it comes out, it is perfectly normal for this to happen. If the coin does end up retracing, it is highly likely that it will go back up again soon.

- **Why do some calls come out at the same time as calls from other sources?**

This is how Metis works. It crawls the web to see what people are talking about and then does its own checks on those coins. And if everything looks good, it posts a new signal. For more details on this, see the 2nd FAQ.

- **Will there be a paid version of Metis?**

Yes, a commercial version of Metis is currently in development and should come out sometime within the next few months. Besides doing what the free version does, it will also have premium signals and will be able to auto-trade for people.

- **Does Metis have Telegram support?**

Not yet, but we do plan on adding Telegram support soon.

- **Will Metis support selling targets?**

Yes, we do plan on adding selling targets support for Metis when we release the commercial version.

- **Who created Metis?**

Metis is maintained and developed by Krish Puri, a serial entrepreneur, trader

and computer scientist from Seattle, WA.

Twitter: <https://twitter.com/krishpuri>

- **Do I need to know anything else before using Metis?**

Yes, before opening a trade, always remember that Metis is simply a tool that's here to make your life easier for you. It is extremely accurate, but mistakes can happen sometimes due to bugs (hasn't happened yet but the possibilities are always there). So always keep this in mind before you put a large amount of money into any trade. And lastly, please always do your own research and trade at your own risk!
